

User Migration Guide

Device Deprovisioning & New Device Onboarding — IT Field Reference

Part 1 — Deprovisioning the Old Device

Backup User Data

- Ensure all important files are backed up to OneDrive or an external storage device.
- Verify that emails, documents, and critical data are secured.

Document System Information

- Record the device name, specifications, and installed applications for reference.

Sign Out and Deauthorize

- Sign out of all accounts (Office 365, Google, etc.).
- Deauthorize any licensed software (e.g., Adobe, Microsoft Office).

Transfer Data

- Use OneDrive or external storage to transfer user data if not already cloud-based.

Wipe the Old Device

- Perform a factory reset or securely wipe the hard drive to ensure data privacy.

Remove from Management Systems

- Unenroll the device from MDM and remove from Active Directory if applicable.

Part 2 — Setting Up the New Device

Initial Setup

- Name the device following the standard format: FirstName LastName Laptop (Device Name).

Join Domain

- Navigate to Settings → Accounts → Access work or school.
- Select Connect → Join this device to a local Active Directory domain → complete the domain join process.

Add Admin Profile

- Press Win + R, type netplwiz, and press Enter.
- Click Add, enter the account details, and add the admin account.
- Change the account group to Administrator.

Install Essential Applications

- Install Google Chrome.
- Install Datto Remote Management agent.
- Install any additional applications required for the user's role.

Transfer User Data

- Sign into OneDrive and sync all user files.
- Import Chrome bookmarks: Settings → Bookmarks → Import bookmarks and settings.

Final Checks

- Verify all applications are functioning correctly.
- Confirm all user data has been successfully transferred.
- Confirm with the user that everything is set up to their satisfaction.
- Ensure the old device is returned and securely stored.
